

Welcome to the ARUP team!

We are excited that you have the opportunity to work with us today! In addition to the jobs you will explore in JA BizTown Adventures, we wanted to show you what degrees you could explore to prepare for a career with us at ARUP Laboratories.

Explore Degrees in Science

Medical Laboratory Scientist

People who perform chemical tests or put bacteria on to a petri dish in the microbiology laboratory for their job are called medical laboratory scientists. At ARUP Laboratories, we have over 4,000 employees working in scientific laboratories who perform tests that are reported back to doctors.

Medical laboratory science gives you opportunities to make a difference in the life and health of those around you. If your family member was sick, having a job that helps make them better would be very satisfying. Search "MLS degrees" to plan your career!

Computer Science

In addition to our scientists, we also have employees who build computer programs for our company.

Computer scientists can develop programs that sort and create databases from laboratory test results or build and maintain the software used to analyze medical images. There are many uses for computer scientists in a medical laboratory setting.

Research and Development Scientist

Do you like to solve puzzles? Maybe you like to experiment and see what happens when you add baking soda and vinegar together. If so, maybe you would like a job in research and development!

Every new medical breakthrough was discovered because someone experimented, observed, and then kept tweaking their experiment over and over until it was developed into something people can use.

In our labs, research and development scientists work to keep improving all the tests and tools we use to help doctors diagnose and treat our communities.
